Why I decided to make this course:

As an Red Teamer & Ethical Hacker, I recognized an urgent need for accessible and affordable resources on tools like Evilginx. When the tool was first released, guidance was scarce, with few available resources on its proper use and deployment in real environments. This led to a steep learning curve, especially for beginners who were new to the tool.

Many of the paid training resources available today are extremely expensive costing upwards of four hundred dollars all the up to thousands. Thus creating a large financial barrier for many aspiring professionals around the world. They are also complex & difficult to understand for beginners who do not have a background in cybersecurity or programming. Real time troubleshooting & support is also almost non-existent. This left many to try to piece together snippets of code & various blog posts to figure out how to configure & use Evilginx properly.

In a field that thrives on continuous learning and community knowledge sharing, I believe it's critical to make such vital information accessible to all. Therefore, I've created this course to bridge this gap. You will learn everything you need here.
